Education

San Jose State University San Jose, CA

Bachelor of Sciences in Computer Science | GPA: 3.7/4.0 *Expected May 2027*

- **Leadership: Spartan Analytics** – VPM; EVP, **Alpha Kappa Psi** – VPM; VP Alumni Relations

Experience

AI Software Engineer Intern | **Tesla** *AI Service Demand Planning Copilot Agent* June 2026 - Dec 2026

- Built and shipped the planning app (React/FastAPI) planners use to investigate demand spikes, architected so other developers can contribute safely: a shared component library, route modules behind a thin app entry point, a data-client facade over domain modules, lint guards that enforce the shared layers, and a visual regression harness across 165 routes.
- Built Ask SDP, a tool-calling LLM copilot over live consumption data, with numeric grounding so answers can't contain invented figures: an output rail checks every number against tool results, a code-gated routing floor forces tool use, a typed verdict stops the model flipping conclusions, and a sandboxed Python tool (AST allow-list, no network) feeds verified results back in.
- Gated routing, metrics and grounding changes in CI with a golden-set eval harness: a fabricated number must fail a negative control, tool-routing coverage 35/35 with 0% free-route answers, 17/17 metric intents, micro-F1 0.854 vs a 0.80 threshold.
- Ran forecasting experiments for vehicle accessories comparing LightGBM, Chronos-2 and TimesFM (lag-0 error $17.0M to $11.6M on backtest, 32% better than baseline), then shipped Forecast Lab: Chronos-2 forecasts, a watchlist and forecast shaping, with guarded write-back to the planning system.
- Built the data pipelines behind the app: weekly demand data into a 77-slide executive deck presented to executives and cross-functional teams (20+ hours of reporting saved per run), plus automated DuckDB freshness (verified builds, atomic swap, 10-minute polling).
- Built a GitHub Actions staging-to-prod pipeline for a team pushing untested code to main: per-branch staging deploys, auto-opened draft PRs, and prod deploys on merge, supporting 200+ staging deploys a week across 10+ data analysts & demand planners.
- Mentored 30+ individuals in service supply chain org on working with AI coding tools (Cursor, Claude Code): prompting and context practices, how to review and verify AI-generated changes, and safe AI practices.

Data Science Intern | **Micron Technology** *AI HBM Wafer Analysis Agent* May 2025 - Aug 2025

- Developed scalable data pipelines in Python and Snowflake SQL to process high-volume manufacturing datasets, enabling pattern analysis across thousands of production steps.
- Automated end-to-end data workflows using Microsoft Copilot and Power Automate, integrating Snowflake queries with GPT-based reasoning to reduce manual analysis time.
- Designed risk classification models using Z-score, failure rate, and wafer size to identify high-risk wafers, enabling engineers to prioritize analysis and implement yield optimization strategies.

Software Engineer Intern | **Hanna Center** *AI Agents & Workflow Automation* Dec 2025 - Jun 2026

- Scoped workflows with non-technical staff, then built in-house LLM tools in Python: a grant-research agent that replaced an enterprise grant platform and a Salesforce field tool for caretakers that replaced a paid add-on, avoiding $30k+ in vendor and subscription cost, plus a website chatbot.
- Engineered automated validation frameworks to evaluate agent accuracy, consistency, and safety, integrating test harnesses, evaluation criteria, and iterative refinement loops based on functional performance.

Software Engineer Intern | **Blue Dome Technologies** *AI/ML Quality Assurance Tool* Aug 2025 - Dec 2025

- Developed and deployed an enhanced, production-ready version of an initial prototype for a full-stack Flask–SQLite QA tool, enabling QA analysts to efficiently review and validate AI-labeled roadway infrastructure images, while incorporating TPM 2.0–backed authentication flows to strengthen device trust and security.
- Collaborated with a product manager and UI/UX designer to plan and execute a 3-sprint Agile roadmap, managing feature milestones and progress in Trello, and regularly communicating updates and technical decisions to the founders to ensure sprint objectives aligned with the product vision.

Projects

IBM Skillsbuild AI Hackathon: AdvisorAI | *Python, React, IBM watsonx Orchestrate Agent*

- Led an 8-person team building a multi-agent academic advising system (orchestrator, RAG, and evaluation agents) with a React frontend on Python services; placed 1st of 9 teams from 700+ applicants.

Technical Skills & Interests

AI / LLM: LLM agents, tool calling, multi-agent orchestration, RAG, evals (golden sets, promptfoo, deepeval), numeric grounding
Languages: Python, TypeScript, JavaScript, SQL
Backend / Frontend: FastAPI, Flask, REST API design, React, Vite, Zustand
Data: DuckDB, MySQL, MSSQL, Vertica, ClickHouse, Snowflake, SQLite, Parquet
Infra / tools: Kubernetes, Docker, GitHub Actions CI/CD, Git, Copilot, Power Automate
